

## Java Library assignment

Continuing the Spring Boot Project

- Create a new library called customers-business-logic

You need to expose methods that will contain some of the business logic for our customers-api

method: isEligible()

params: age

return: boolean

This method should take the field age and test if the Customer is older than 17 years.

method: isValid()

params: Customer

return: boolean

This method should validate if name, email & age are informed.

method: residesWith()

params: Customer1 & Customer2

return: boolean

This method should validate if the Customers live in the same address.

Do not forgot dependencies:

Note that since we have changes on the CustomersAPI application, you need to send both APIs.

Thank you,

Have a happy coding 😊
